App Idea

Decision Fatigue

refers to the deteriorating quality of decisions made by an individual after a long session of decision making.

Barack Obama, Steve Jobs, and Mark Zuckerberg have been known to reduce their everyday clothing down to one or two outfits in order to limit the number of decisions they make in a day. [wiki: Decision Fatigue]

App Idea

What if you could manage to everyday wear the perfect outfit without it being the same outfit?

App Idea

What if you could manage to everyday wear the perfect outfit without it being the same outfit?

Perfit

To develop an Android application that alleviates the mental energy of outfit selection in the morning.

- The user builds a virtual closet and the application formulates an outfit suggestion.
- Suggestions are based on the user's desire for "Sports, Fashionable, Comfortable",
- Suggestions take into account clothes' cleanliness
- Suggestions take into account weather

COMPLETE USER INFORMATION

The image shows a mobile application interface for a login screen. At the top, there is a header image featuring a wooden background with a white circular outline and a hanger icon inside. Below the header, the word "LOGIN" is centered. There are two input fields: "Email ID" and "Password". Below the "Password" field, there is a link "Forgot Password?". A large black button with the text "Login" is positioned below the input fields. At the bottom, there is a link "Don't have an account? [Register](#)". The bottom of the screen shows a standard Android navigation bar with three icons: a square, a circle, and a triangle.

3. Suggestion Algorithm

3. Suggestion Algorithm

- 1) Choose season either **WINTER-FALL** OR **SUMMER-SPRING**
- 2) Select the purpose **SPORTY CASUAL FORMAL NIGHT**
- 3) App will suggest an outfit that fits those descriptions and is clean (available) in closet
- 4) The user can ask the app to **retry** and make new suggestion or go back

4. Watch Implementation

Idea is to reduce cleanliness of outfit if the users heartbeat is above certain threshold
(i.e. if the user is running or hiking the items cleanliness go down quicker)

4. Watch Implementation

- 1) The watch is notified when we select a outfit and recover the cleanliness of the outfit.
- 2) The watch start to take the heart rate.
- 3) For a define interval of time, depending of the heart rate we reduce the cleanliness of the outfit.
- 4) The cleanliness of the clothes is shown on the watch.
- 5) The watch notified the smartphone of the new cleanliness of the clothes.

Thank you for your attention

Special thanks to our assistant,

Rafa Medina and professor Giovanni Ansaloni
